Attachment D

DEC Protocol: Exposure Record

Fill out this form at the scene and send it with the child to the physician for the initial medical assessment.

This form should become a part of the child's medical record

This form is used to document potential chemical exposure to children who are found in association with a clandestine methamphetamine laboratory. It should be completed at the scene by a law enforcement officer and sent with the child to the physician for an initial medical assessment. For each chemical found, circle the appropriate icon to represent the degree of exposure:

In container at site

Circle this icon when a chemical is found at the site in a closed container.

Spilled or open

Circle this icon when a chemical is found at the site in an open container or spilled in the environment.

Contact with the child

Circle this icon when a chemical is found spilled on the child's clothes or otherwise in contact with the child.

+ Environmental Monitoring

Circle this icon when an environmental test reveals the presence of the chemical in the environment.

For each section of the form, use the blank lines to fill in other chemicals found.

Use the Notes/details section to further describe any exposure.

If form is not complete when child is taken to the physician, send a partially completed form with the child and supplement with a completed form as soon as possible.
